MINE / SETUP GUIDE

Run MINE in ChatGPT.

A Project or custom GPT with the MINE files as sources.

Before you start

Download the MINE AI Operating Kit from thevybe.us/ai. These files are instructions you load into ChatGPT. They are not a hosted agent, API or live integration, and uploading them does not give any assistant access to your accounts. Review every output before you publish or send anything.

Files you will use

- START_PROMPT.md (paste into the instructions field)
- core/SOUL.md, MEMORY.md, INSTRUCTIONS.md, AGENT.md
- knowledge/MINE_Value_Refinery_Playbook_v3.pdf (the free book)
- skills/ (ten SKILL.md workflows)

Setup

01	Create a Project named MINE - The Value Refinery.
02	Paste START_PROMPT.md into the Project instructions.
03	Add SOUL.md, MEMORY.md, INSTRUCTIONS.md, AGENT.md, the playbook PDF and the skill files as Project sources where supported.
04	Open a new chat inside the Project, send the first message below and run TEST_PROMPTS.md.

05 For a reusable assistant, consider a custom GPT where available. Project files do not create callable Skills or structured long-term memory on their own.

06 Re-upload the dated MEMORY.md when material facts change. Do not rely on automatic sync between accounts.

First message to send

```
Read the attached SOUL, MEMORY, INSTRUCTIONS and AGENT files and the Value Refinery Playbook. Report exactly which files you accessed, summarize MINE in 100 words, and recommend one 10-minute Value Map exercise. Do not claim access you cannot confirm.
```

Notes

- Check current instructions at openai.com/academy. Features vary by plan.

Then run the five stages in order: Mine, Grade, Refine, Forge, Move. Cite your own evidence, treat unclear rights as blocked, and ask for a preview before anything is sent, published, paid or uploaded.

Want it done with you? Request a Value Refinery Session on Instagram, @juicebigfellow, or book R3D Reel at thevybe.us/r3d.
