MINE / SETUP GUIDE

Run MINE in Codex.

Agent rules and skills for the Codex coding agent.

Before you start

Download the MINE AI Operating Kit from thevybe.us/ai. These files are instructions you load into Codex. They are not a hosted agent, API or live integration, and uploading them does not give any assistant access to your accounts. Review every output before you publish or send anything.

Files you will use

- AGENTS.md from the kit (agent rules)
- core/ files and the playbook PDF placed in your project folder
- skills/ folders (SKILL.md format)

Setup

01	Place the kit in your repository, for example in mine/.
02	Put AGENTS.md at the repository root. Codex reads AGENTS.md for project instructions.
03	Point the agent at mine/core/AGENT.md, SOUL.md, MEMORY.md and INSTRUCTIONS.md.
04	Install the skills/ folders where your Codex setup loads skills, or reference them as files.
05	Send the first message below and test with TEST_PROMPTS.md.

06 Keep local tests separate from deployment proof, and require approval before it executes anything.

First message to send

```
Read the attached SOUL, MEMORY, INSTRUCTIONS and AGENT files and the Value Refinery
Playbook. Report exactly which files you accessed, summarize MINE in 100 words, and
recommend one 10-minute Value Map exercise. Do not claim access you cannot confirm.
```

Notes

- Exact file locations change by version. Check current OpenAI Codex documentation.

Then run the five stages in order: Mine, Grade, Refine, Forge, Move. Cite your own evidence, treat unclear rights as blocked, and ask for a preview before anything is sent, published, paid or uploaded.

Want it done with you? Request a Value Refinery Session on Instagram, @juicebigfellow, or book R3D Reel at thevybe.us/r3d.
