MINE / SETUP GUIDE

Run MINE in Copilot.

Custom instructions for GitHub Copilot and Agent Skills compatible tools.

Before you start

Download the MINE AI Operating Kit from thevybe.us/ai. These files are instructions you load into Copilot. They are not a hosted agent, API or live integration, and uploading them does not give any assistant access to your accounts. Review every output before you publish or send anything.

Files you will use

- AGENTS.md from the kit (agent rules)
- core/ files and the playbook PDF placed in your project folder
- skills/ folders (SKILL.md format)

Setup

01	Place the kit in your repository, for example in mine/.
02	Add AGENTS.md at the root, or put the MINE rules in .github/copilot-instructions.md, depending on what your Copilot version reads.
03	Reference mine/core files in your chat or agent mode so Copilot reads SOUL, MEMORY and INSTRUCTIONS first.
04	Use the skills/ folders where your environment supports agent skills. The mine-brand skill is written for any Agent Skills compatible system.

05 Send the first message below. Require a preview before it edits files, sends anything or deploys.

First message to send

```
Read the attached SOUL, MEMORY, INSTRUCTIONS and AGENT files and the Value Refinery
Playbook. Report exactly which files you accessed, summarize MINE in 100 words, and
recommend one 10-minute Value Map exercise. Do not claim access you cannot confirm.
```

Notes

- Exact file locations change by version. Check current GitHub Copilot documentation.

Then run the five stages in order: Mine, Grade, Refine, Forge, Move. Cite your own evidence, treat unclear rights as blocked, and ask for a preview before anything is sent, published, paid or uploaded.

Want it done with you? Request a Value Refinery Session on Instagram, @juicebigfellow, or book R3D Reel at thevybe.us/r3d.
