MINE / SETUP GUIDE

Run MINE in Cursor.

Project rules and agent skills in your workspace.

Before you start

Download the MINE AI Operating Kit from thevybe.us/ai. These files are instructions you load into Cursor. They are not a hosted agent, API or live integration, and uploading them does not give any assistant access to your accounts. Review every output before you publish or send anything.

Files you will use

- AGENTS.md from the kit (agent rules)
- core/ files and the playbook PDF placed in your project folder
- skills/ folders (SKILL.md format)

Setup

01	Put the kit in your project folder, for example a folder named mine/ with core/, skills/ and knowledge/.
02	Add AGENTS.md at the project root so the agent reads the MINE rules first, or copy its contents into a Cursor project rule.
03	Tell the agent to read mine/core/AGENT.md, SOUL.md, MEMORY.md and INSTRUCTIONS.md before advising.

04	Place the skills/ folders where your Cursor setup loads agent skills, or reference them as files.
05	Send the first message below. Do not let the agent run scripts, post content or change production systems unless you authorize it.

First message to send

```
Read the attached SOUL, MEMORY, INSTRUCTIONS and AGENT files and the Value Refinery Playbook. Report exactly which files you accessed, summarize MINE in 100 words, and recommend one 10-minute Value Map exercise. Do not claim access you cannot confirm.
```

Notes

- Exact file locations change by version. Check current Cursor documentation.

Then run the five stages in order: Mine, Grade, Refine, Forge, Move. Cite your own evidence, treat unclear rights as blocked, and ask for a preview before anything is sent, published, paid or uploaded.

Want it done with you? Request a Value Refinery Session on Instagram, @juicebigfellow, or book R3D Reel at thevybe.us/r3d.
