MINE / SETUP GUIDE

Run MINE in Gemini.

A Gem or persistent workspace with the MINE files attached.

Before you start

Download the MINE AI Operating Kit from thevybe.us/ai. These files are instructions you load into Gemini. They are not a hosted agent, API or live integration, and uploading them does not give any assistant access to your accounts. Review every output before you publish or send anything.

Files you will use

- START_PROMPT.md (paste into the instructions field)
- core/SOUL.md, MEMORY.md, INSTRUCTIONS.md, AGENT.md
- knowledge/MINE_Value_Refinery_Playbook_v3.pdf (the free book)
- skills/ (ten SKILL.md workflows)

Setup

01	Open gemini.google.com and create a Gem (or use a persistent workspace).
02	Paste START_PROMPT.md into the instructions field.
03	Upload SOUL.md, MEMORY.md, INSTRUCTIONS.md and the playbook where supported.
04	Use the individual SKILL.md files as reference workflows unless your Gemini environment supports skills.

05	Start a new conversation, send the first message below and confirm it can recall the files.
06	Review Drive and Gmail access separately. MINE does not need them.

First message to send

```
Read the attached SOUL, MEMORY, INSTRUCTIONS and AGENT files and the Value Refinery
Playbook. Report exactly which files you accessed, summarize MINE in 100 words, and
recommend one 10-minute Value Map exercise. Do not claim access you cannot confirm.
```

Notes

- There is no automatic memory sync between providers.

Then run the five stages in order: Mine, Grade, Refine, Forge, Move. Cite your own evidence, treat unclear rights as blocked, and ask for a preview before anything is sent, published, paid or uploaded.

Want it done with you? Request a Value Refinery Session on Instagram, @juicebigfellow, or book R3D Reel at thevybe.us/r3d.
